

Al₂O₃ x 2H₂O

21. The collaborative object architecture of claim 20, wherein the at least one system receives input, generates one or more messages to the pod in response input, and applies the input locally without waiting for a response from the pod.

22. The collaborative object architecture of claim 20, wherein the pod is configured to receive message packets from an applet, determine an order in which to process the received message packets and communicate data from processing to other applets such that the other applets receive the data from messages originating at the

23. A method comprising:

executing a pod having a first plurality of constituent parts on a server system
 ed to at least one client adapted to execute an applet having a second plurality of
 tuent parts;

receiving, at the pod, at least one message from one of the second plurality of
tuent parts indicating a change to data controlled by the first plurality of
tuent parts;

processing the at least one message by the pod, such that a change to one of
second plurality of constituent parts causes a change to a corresponding constituent
in the first plurality of constituent parts.

24. The method of claim 23 further comprising the step of determining an in which to process the received at least one message.

25. The method of claim 24 further comprising the step of communicating data resulting from the processing to the third plurality of constituent parts, wherein the first applet continues execution prior to processing the at least one message.

26. A computer readable medium having stored thereon sequences of instructions which when executed cause one or more electronic systems to:

execute a pod having a first plurality of constituent parts on a server system coupled to at least one client adapted to execute an applet having a second plurality of constituent parts;

receive, at the pod, at least one message from at least one of the second plurality of constituent parts indicating a change to data controlled by the first plurality of constituent parts; and

process the at least one message by the pod such that changes to at least one of the second plurality of constituent parts cause changes to a corresponding constituent part in the first plurality of constituent parts.

27. The computer-readable medium of claim 26 wherein the sequences of instructions further comprise sequences of instructions for determining an order in which to process the received at least one message.

28. The computer-readable medium of claim 26 wherein the sequences of instructions further comprise sequences of instructions for communicating data resulting from the processing to a second applet, wherein the first applet continues execution prior to processing of the at least one message.

29. A method comprising:

receiving an input that indicates a change to data controlled by at least one of a first plurality of constituent parts;

processing the input by a pod such that changes to at least one of the plurality of constituent parts cause changes to a second corresponding plurality of constituent parts in the pod; and

sending at least one message indicating a change to data controlled by the first plurality of constituent parts to a third plurality of constituent parts having constituent parts corresponding to the first and second constituent parts.

30. The method of claim 29 wherein the pod determines an order in which to process the received at least one message and communicates the change to at least a second plurality of constituent parts. - -
